Case Study

Oil Salvage Ltd is one of Britain's largest specialist waste management organisations offering an all-inclusive service covering collection, treatment, disposal, reprocessing and recycling of waste oils and other hazardous materials.

The company has been established in Merseyside since 1986 and in discussions with the Environmental Agency about long term prevention of any pollutants entering the groundwater, they recently decided to improve the containment security of a number of bunds around existing oil and other waste storage tanks.

The bund walls were constructed of brick and block masonry that required to be made watertight with oil, and fuel resistant linings and sealants and Resitech were appointed as the Specialist Contractor to carry out the works, Their Materials Consultants, **NCC**, recommended the proven Sika Bund Lining System which consists of slurry applied waterproofing, chemically resistant coating and high performance joint sealants.

The system was applied on more than 250m² of bund walls and completed in just four weeks to the satisfaction of the client and the Environmental Agency.
