Case Study

This catering butchers and meat processing factory in Northern Germany was having problems with worn floors in an area requiring approval for use in contact with foodstuffs, due to the heavy equipment and abrasive pallet trucks and small wheeled containers used extensively around the plant. They had previously tried epoxy resin based coatings, but they had not given the length of service they were looking for in this high wear environment that is exacerbated by frequent hot water and steam cleaning with additional detergents. Additionally as the plant was fully operational, the owners wanted a fast turnaround system with as short a downtime as possible, so that all of the works to nearly 500m² of the plant, could be done over a routine holiday shutdown.

Specialist Contractors, Rüdiger Schmidt GmbH, were asked for advice and together with VIP proposed a complete solution using VIP QuickSpray Industrial W, followed by VIP QuickCoat in RAL 3020 red, with KTW and WRAS potable water contact approval certificates. This is a 2-component, hot-spray applied, polyurea resin based system for highly abrasion and chemically resistant floors, including the incorporation of beads to achieve an anti-slip class R11 - suitable for wet food process environments.
